Applied business Analytics Practical

Practical – II

Roll No.:T047	Name:Ashwin Tripathi
Class:SYIT	Batch:1
Date of Assignment:31/07/26	Date/Time of Submission:31/07/26

2. Describing the Distribution of a Variable:

a. Obtain a dataset and calculate descriptive statistics (mean, median, mode, variance, etc.) for a specific variable of interest.

```
[58] import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
Python

[22] df = pd.read_csv("Orders.csv")
Python

[29] print("Minimum :", shipping.min())
Python
... Minimum : 0.49

[30] print("Maximum :", shipping.max())
Python
... Maximum : 164.73

[31] print("Range :", shipping.max() - shipping.min())
Python
... Range : 164.23999999999998

[32] print("Variance :", shipping.var())
Python
... Variance : 298.04749034418774

[33] print("Standard Deviation :", shipping.std())
Python
... Standard Deviation : 17.264051967721475

[34] print("Count :", shipping.count())
Python
... Count : 8399
```

```
[35] ✓ 0.0s Python
... Sum : 107831.04000000001

[36] ✓ 0.0s Python
...
Descriptive Statistics
count      8399.000000
mean       12.838557
std        17.264052
min         0.490000
25%         3.300000
50%         6.070000
75%        13.990000
max        164.730000
Name: Shipping Cost, dtype: float64
```

b. Create visualizations (histograms, box plots) to depict the distribution of a variable and analyze its characteristics.

```
import seaborn as sns
plt.figure(figsize=(8,3))
sns.boxplot(x=sales, color="orange")
plt.title("Box Plot of Sales")
plt.xlabel("sales")
plt.show()
```
